

# Pure Bubble Sort

Bubble sort, sometimes referred to as sinking sort, is a simple sorting algorithm that repeatedly steps through the list, compares adjacent elements and swaps them if they are in the wrong order. The pass through the list is repeated until the list is sorted.

## Example:

if array contains total five numbers  $a[] = \{5,1,4,2,8\}$ , then

### First Pass:

$(5\ 1\ 4\ 2\ 8) \rightarrow (1\ 5\ 4\ 2\ 8)$ , Here, algorithm compares the first two elements, and swaps since  $5 > 1$ .

$(1\ 5\ 4\ 2\ 8) \rightarrow (1\ 4\ 5\ 2\ 8)$ , Swap since  $5 > 4$

$(1\ 4\ 5\ 2\ 8) \rightarrow (1\ 4\ 2\ 5\ 8)$ , Swap since  $5 > 2$

$(1\ 4\ 2\ 5\ 8) \rightarrow (1\ 4\ 2\ 5\ 8)$ , Now, since these elements are already in order ( $8 > 5$ ), algorithm does not swap them.

### Second Pass:

$(1\ 4\ 2\ 5\ 8) \rightarrow (1\ 4\ 2\ 5\ 8)$

$(1\ 4\ 2\ 5\ 8) \rightarrow (1\ 2\ 4\ 5\ 8)$ , Swap since  $4 > 2$

$(1\ 2\ 4\ 5\ 8) \rightarrow (1\ 2\ 4\ 5\ 8)$

$(1\ 2\ 4\ 5\ 8) \rightarrow (1\ 2\ 4\ 5\ 8)$

Now, the array is already sorted, but our algorithm does not know if it is completed. The algorithm needs one **whole** pass without **any** swap to know it is sorted.

### Third Pass:

$(1\ 2\ 4\ 5\ 8) \rightarrow (1\ 2\ 4\ 5\ 8)$

$(1\ 2\ 4\ 5\ 8) \rightarrow (1\ 2\ 4\ 5\ 8)$

$(1\ 2\ 4\ 5\ 8) \rightarrow (1\ 2\ 4\ 5\ 8)$

$(1\ 2\ 4\ 5\ 8) \rightarrow (1\ 2\ 4\ 5\ 8)$

As there are no swaps in third pass, further passes will not be run.

## Input Format

The first line contains an integer,  $n$ , the size of the array

The second line contains  $n$  space-separated integers  $a[i]$ .

## Constraints

2

## Output Format

You must print the following three lines of output:

1. Array is sorted and printed in ascending order
2. Total number of comparisons
3. Total number of swaps.

## Sample Input 0

```
3
1 2 3
```

## Sample Output 0

```
1 2 3
2
```
